A reversible reaction is a chemical reaction where the reactants form products that, in turn, react together to give the reactants back. Reversible reactions will reach an equilibrium point where the concentrations of the reactants and products will no longer change.

**What Is a Reversible Reaction? - ThoughtCo**

When you think of chemical reactions, you might think of them as irreversible, permanently changing one substance into another. While this is true in some cases, some chemical reactions are reversible, and we can take the products of the reaction and turn them back into the reactants. These reversible reactions can, under certain conditions, reach what we call 'equilibrium'.

The reverse reaction rate increases as equilibrium is approached because as the reaction goes from

left to right, the concentrations of the products increases, therefore there are more product collisions causing the reverse reaction rate to increase. As a reaction is approaching equilibrium describe how the following change.

Watch a reaction proceed over time. How does total energy affect a reaction rate? Vary temperature, barrier height, and potential energies. Record concentrations and time in order to extract rate coefficients. Do temperature dependent studies to extract Arrhenius parameters. This simulation is best used with teacher guidance because it presents an analogy of chemical reactions.

The previous lesson introduced students to reversible reactions and the concept of equilibrium. Today's lesson will reinforce both concepts using a computer simulation to help us observe the particles as they "react".
