Statistics 110: Probability - Harvard University

Relative Risk (RR) is often used when the study involves comparing the likelihood, or chance, of an event occurring between two groups. Relative Risk is considered a descriptive statistic, not an inferential statistic; as it does not determine statistical significance. Relative Risk utilizes the probability of an event occurring in one group compared to the probability of an event occurring in ...

You can put this solution on YOUR website! From the condition, - the probabilities to have G or R at the first intersection are each equal to $\frac{1}{2}$; - if there is R at the first intersection, then the probability to have R at the second intersection is $\frac{1}{2}$, while the probability to have G at the second intersection is $\frac{1}{2}$. From it, the probability under the question is $= \frac{1}{2}$.
