Colligative Properties of Electrolytes. As noted previously in this module, the colligative properties of a solution depend only on the number, not on the kind, of solute species dissolved. For example, 1 mole of any nonelectrolyte dissolved in 1 kilogram of solvent produces the same lowering of the freezing point as does 1 mole of any other nonelectrolyte.

Properties of Solutions: Electrolytes and Non-Electrolytes

Electrolytes and Colligative Properties. Ionic compounds are electrolytes and dissociate into two or more ions as they dissolve. This must be taken into account when calculating the freezing and boiling points of electrolyte solutions. The sample problem below demonstrates how to calculate the freezing point and boiling point of a solution...

Apparent large deviations of water solutions from ideal behavior are eliminated by taking account of the number of water molecules binding to solute sufficiently strongly (13.0 ± 1.5 kcal mol⁻¹) as to be removed from the "bulk" solvent. Freezing point, boiling point, vapor pressure, and osmotic pressure measurements of electrolyte solutions of chlorides, bromides, and iodides are treated ...

He noted that the number of dissolved ions in solution is directly related to the strength of the solution's electrical potential. Compounds that dissolve by breaking into ions and conduct electricity in solution are known as electrolytes. Most soluble salts, acids and bases are electrolytes.

Solutions, Electrolytes and Nonelectrolytes - Study.com

An electrolyte is a substance that produces ions in a solution. Because of those ions, the solution of an electrolyte has electrical conductivity. Remember, the TDS meter is based on ions conducting electrical current. An electrolyte can be classified as strong or weak depending on how well it conducts electricity.
